

Lab 9

Due	No Due Date	Points	10	Available	after Mar 2 at 12am
------------	-------------	---------------	----	------------------	---------------------

Sorting

In order to get credit for the lab, you need to be checked off by the end of lab. For non-zero labs, you can earn a maximum of 3 points for lab work completed outside of lab time, but you must finish the lab before the next lab.

(8 pts) Sort the array and check prime numbers

Create a program which will sort an array of integers in ascending order using one of the sorting algorithms we discussed in class (selection, insertion, or merge--NOT BUBBLE), and indicate whether each integer element is a prime number.

- (1 pt) Create a 1-D dynamic array of integers which is randomly filled with values between 1 and 100
- (1 pt) Establish the length of the array based on user input
- (1 pt) Error handle the user input to make sure it is a valid number greater than zero and less than or equal to twenty-five
- (1 pt) Print the elements of the array
- (1 pt) Create a copy of the array and use your chosen sorting algorithm to sort it in ascending order
- (1 pt) Print the elements of the sorted array
- (1 pt) Print out all prime numbers of the array
- (1 pt) End the program and make sure all memory has been freed (there should be no memory leaks!)

Make sure your program is decomposed into appropriate functions which could be reused on other data structures.

(2 pts) Assignment 5 Design

Show your TA some work towards your Assignment 5 design. Draw pictures of the relationships between the classes and how the nodes are swapped, inserted, and deleted. Write pseudocode to describe the actions occurring in your drawing.
